There are many serious problems with community health, including tb, sexually transmitted illnesses, substance abuse, and mental illness, so why the emphasis on injecting vaccines into healthy people? What is the evidence that Tdap in pregnant women decreases pertussis? And what data do you rely on to show safety? While HPV may decrease genital warts, where is the evidence that it decreases cervical cancer, and what is the incidence of serious adverse effects? There is no evidence that increasing flu vaccines has decreased deaths from influenza/pneumonia, and evidence that it increases other respiratory illnesses. It also appears to have more reported serious adverse events such as paralysis from Guillain-Barre than most other vaccines except HPV and COVID
